Note: OG* Open ground, bare rooted plants are available from July through to late August only. Limited numbers are available as potted trees outside the bare rooted (OG) dormant season. New season potted plants become ready from October through to April depending on variety. Plants can be ordered in advance and delivered the following year on confirmation of order.

BASIC PRINCIPLES OF SHELTER

- 1) **Porosity** Shelter should slow the wind not stop it altogether.
Very dense belts such as bamboo dump the wind on the lee side.
- 2) **Height** Preferably as tall as the site allows. Shorter to the north of buildings, sheds, tracks and farm crossings or similar sites to avoid too much shading. On farms, ultra high pruning of tall shelter trees can allow light to pass below the crown of the tree and assist in avoiding excess shading. Deciduous trees can provide excellent shelter and shade in late spring, summer and autumn but very little shading in the winter.
- 3) **Continuity** Make belts as continuous as possible (gateway wide gaps are okay) to avoid wind accelerating through the gaps and around the ends of the rows.
- 4) **Spacing**

Formal trimmed hedges	0.3 – 1m high	4 - 6 plants per metre
	1m – 2.5m	3 plants per metre
Farm or horticultural shelter	1 plant per metre	
Timber belts – single row	1 plant per 2 – 3 metres = 333 – 500 per km.	
– double row	2m x 2m or 2.5m x 2.5m = 800 – 1000 per km.	

Largest plant size for the courier 1.7m.

Freight trucks can take larger grades and larger numbers of plants to some locations & depots.

Plants can be ordered in advance for delivery the following year on confirmation of order.
New season potted plants become ready from October through to April depending on variety.
